

Make a PDF for a Flipbook

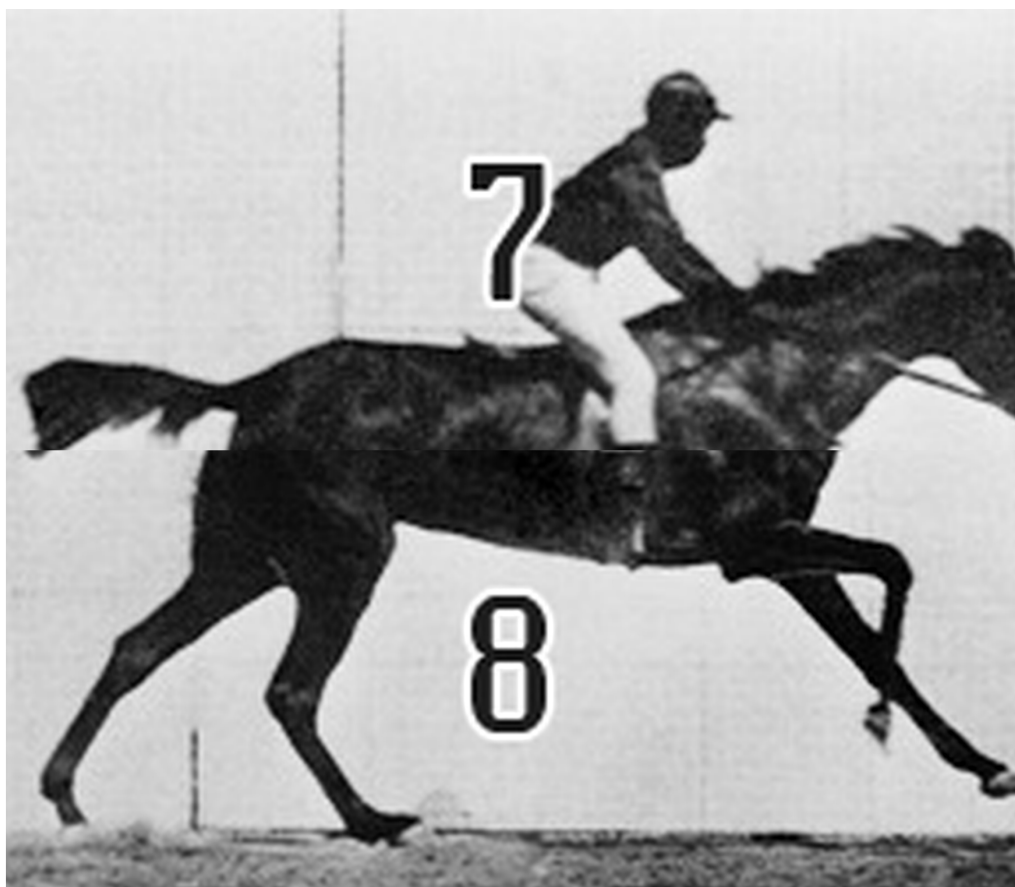

If you're making a hand-cranked flipbook like [this](#) or [that](#) or [this](#) - creating the printable PDF from the animation by yourself is a pain. Fear not, this script is here.

It takes a folder full of images in folder `/animation` and crops them, stitches the current and the next frame together. On the last frame, the first one is used again for continuous rotation. Check the [test result](#) out:

[\(source\)](#)

Result of 7th page: Current upper half and the lower half of the next frame, cropped/fitted to one A3 page:

The images are stored in the `/processed` folder: Firstly scaled and then after the re-composition.

Tips

Change the desired output width/height for each frame at the beginning of the script.

Make sure to name the files with leading zeros `01.jpg` and `02.jpg` not `1.jpg` as the files are not rearranged naturally.

Use `ezgif` for GIF animation to single jpegs.

Or use `ffmpeg` `ffmpeg -i "input.mp4" -vsync 0 frames/frame_%05d.png` for video files.

Notes

Landscape and A3 is hardcoded.

Installation

```
pip install pillow reportlab
```

Shamefully Vibe "coded".
